# Introduction

The purpose of this Python application is to create g-code for cnc milling/routing machines for hobbyist use.

## System requirements

The application was tested with the following systems:

- i7-4712MQ 8GB, Ubuntu Linux 16.04 (precise) 4.4.0-72-generic (64-Bit), Python 2.7.12, LinuxCNC 2.8.0~pre1 Simulation
- Atom330 1GB, LinuxCNC-2.7 wheezy, Python 2.7.12, LinuxCNC 2.7.8

## Installation

Extract the package and move the Folder <SimpleGcodeGenerator> to the destination where you want it.

Make the Python file <SimpleGcodeGenerator\_vX.X.X.py> executable.

Edit the paths in the section <LINUXCNC> of the ini-file <sgg.ini>.

Edit the default values in the ini-file <defaults.ini> to your needs.

### CXF-Fonts for text engraving

Since I am not sure about the license, I do not provide the fonts which come with the QCAD package.

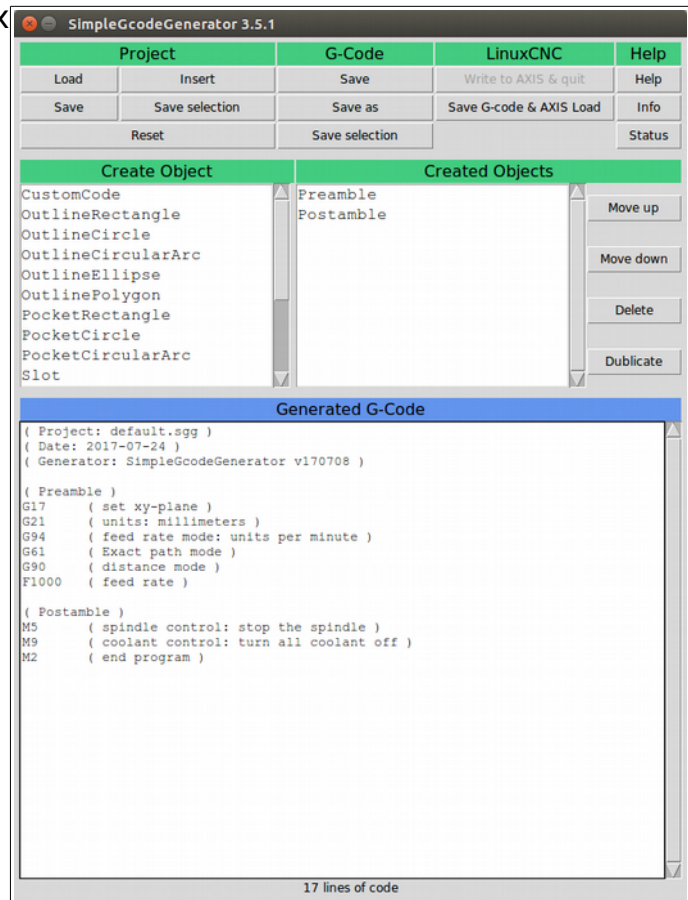

A package can be downloaded here:

<http://forum.librecad.org/attachment/4655223/0/FONTS.zip>

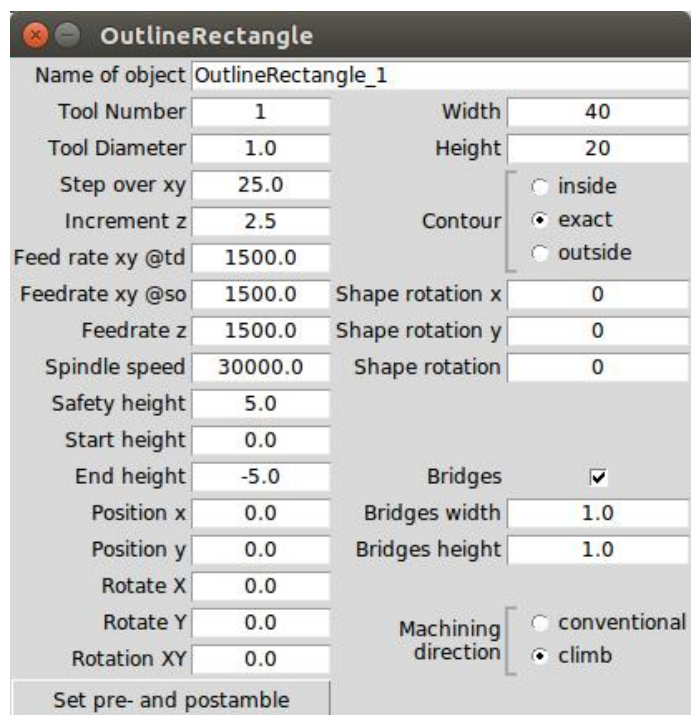

# Quick start guide

- Select „Preamble“ in the listbox <Created Objects>.
- <Double-Left-Click> on „OutlineCircle“ in the listbox <Create Object>

The parameter edit frame <OutlineRectangle> will show up and the new object will be inserted in the <Created Objects> list after „Preamble“.

- Now the parameters of this object can be edited. The changes take effect almost immediately. UNDO is not possible.
- <Right-Click> on the entry fields of <Tool Number> or <Tool Diameter> will show up the tool selection frame.
- <Right-Click> on the entry fields of <Feed rate xy @td>, <Feed rate xy @so> and <Spindle speed> will show up the feeds and speeds frame.
- <Left-Click> on <Set pre- and postamble> will show up the object specific options for the pre- and postamble.

## Specific default Pre- and Postamble

If you need your own specific pre- and postambles, you have to choices:

- Edit the source code (not recommended)
- Create two ngc-files named `<preamble.ngc>` and `<postamble.ngc>`, placed in the `<SimpleGcodeGenerator>` folder. They will be loaded at start-up.

## Tables for feeds and speeds

For adding more tables check out the file `<Tables.ods>` in the folder „data/feedsnspeeds“. Create a new sheet from an existing one and export it as csv.

The program expects csv-files with semicolon separated data and the data beginning with one line of headers after the keyword „Data“ in the line before.

## How to add milling features

To add a feature (eg. Pocket milling) the source files `"ncclasses.py"` and `"guiclasses.py"` must be edited.

Find a short howto below. Please contact the author for detailed questions if necessary.

### 1. Add the logic

- Source file: `"ncclasses.py"`
- If you want to use all the basic parameters from `"class Basedata(object)"` copy the class `"class TEMPLATE(Basedata, Basemethods)"` and modify to your needs. The available g-code classes are defined in the file `"gcode.py"`.
- If you do NOT want the basic parameters, copy the class `"Custom code"` and modify it to your needs.
- Add the name of the new class to the list `"NCCLASSES"` at the end of the file.

### 2. Add the gui

- Source file: `"guiclasses.py"`
- If you want to use all the basic parameters from `"class Basedata(object)"` copy the class `"class TEMPLATE(Basedata, Basemethods)"` and modify to your needs.
- If you do NOT want the basic parameters, copy the class `"Custom code"` and modify it to your needs.

- Add the name of the new class to the list "GUICLASSES" at the end of the file.

3. Check implementation.

- Start the application.
- Check if the new class appears in the CreateObject-List.
- Create a new object with the new class and start bugfixing ;-)

4. Send the new classes to the author if you want.
